

Product engineering & technical direction

I help founders and business owners work through technical decisions and build or improve their products. That can include an app, a website, an algorithm, hardware, or the connections between them.

WHERE I HELP

Technical guidance

I help work through an important decision, compare approaches, or review what already exists. It can be a single conversation, even when you are doing the building yourself.

Product development

I help shape the product, design its architecture and user experience, and develop, test, and release it. I can help bring in another specialist when needed.

Focused engineering

I resolve a specific problem or build a missing part: a website improvement, an unfinished feature, an algorithm, a hardware interface, or a software integration.

Ongoing technical leadership

As a part-time technical lead or fractional CTO, I help make engineering decisions, unblock development, and set up infrastructure the team can maintain. I can help find a founding engineer and prepare the work for them to take over.

RELEVANT EXPERIENCE

Æthos · Co-founder & CTO

With my co-founder, I've taken Æthos from concept to active deployment, leading its architecture, hands-on development, and a small team, and turning user feedback into scoped releases.

HOW I WORK

Understand the problem

I work from what exists, what matters to the people using it, and which decisions are still uncertain.

Test the critical path

I test the assumptions most likely to change the design, using prototypes and the real operating environment.

Leave it usable

I improve the code, tooling, and documentation so the next person can understand and continue the work.

WORKING TOGETHER

We can start with the question or piece of work that needs attention. We align expectations about my involvement, the next useful result, timing, and payment, then revisit them as the product and team change.

Tell me what you're building, what exists, and where you need help.
